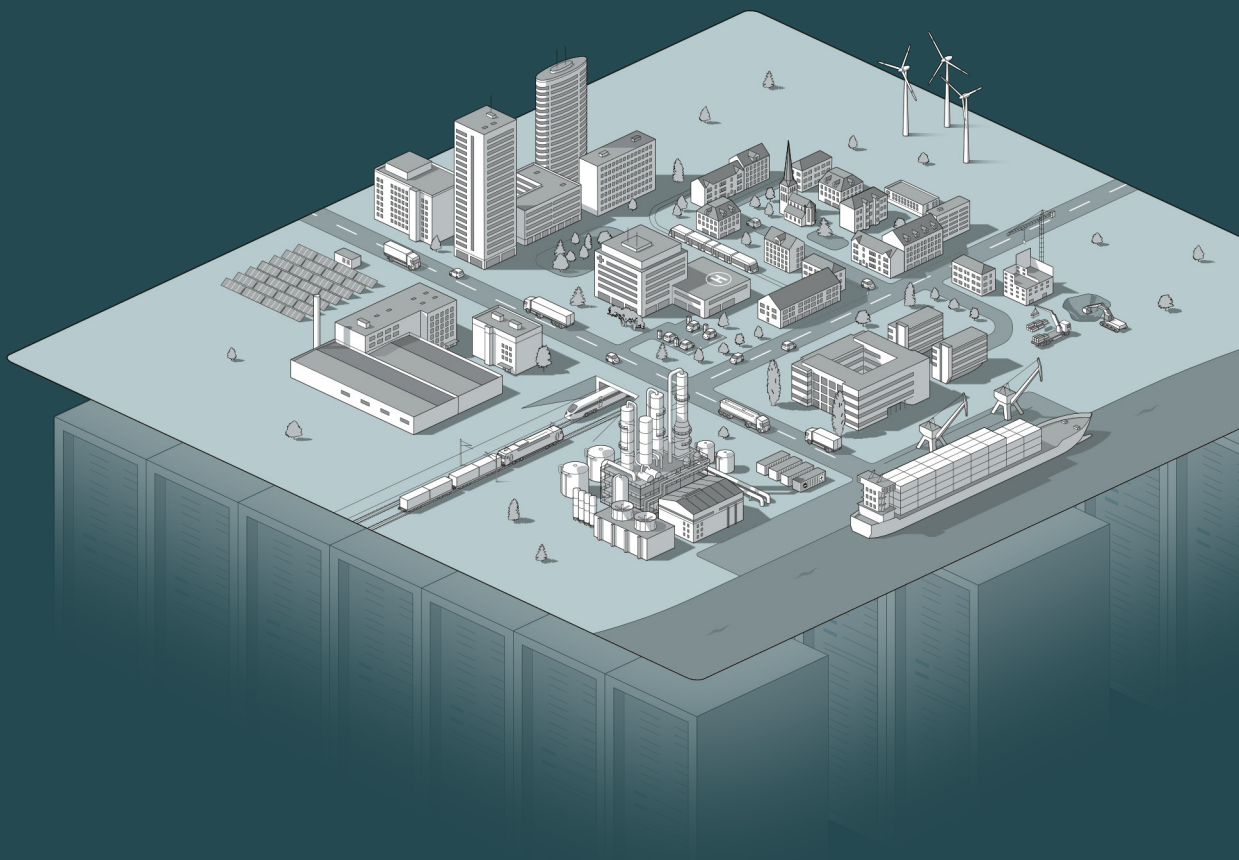
OSISM

Overview

The platform and the people behind it.



Digital sovereignty provides freedom of action, but also makes managing cloud infrastructures noticeably more complex. That is why we developed OSISM. The platform enables you to build, manage and operate even demanding cloud infrastructures – cost-effectively and with long-term independence. To achieve this, we rely on proven open-source technologies. This way, you avoid dependencies on individual service providers and proprietary solutions. Even on us.

About OSISM

Since 2016, we at OSISM GmbH have been planning and building robust cloud infrastructures across Europe. We are certified as an *SCS IaaS Integrator* for building SCS-compliant environments.

We develop the OSISM platform, which is based on OpenStack, and also use it in our own projects. The key benefits of OSISM:

- ✓ Transparency and control through open source
- ✓ Integrated technology stack
- ✓ Flexible and modular
- ✓ Developed in Germany
- ✓ Personal contact

OSISM is based on open standards. The platform is therefore suitable for building environments that meet the specifications of the German Public Administration Cloud (DVC), and follows the C3A criteria of the Federal Office for Information Security (BSI).

Tried and tested

OSISM is used in the pharmaceutical, chemical and manufacturing industries, in the energy sector, at universities, at a German federal state's data centre and by municipal IT service providers, including operators of critical infrastructure (KRITIS).

Subscription

As open-source software, OSISM is free to use. For professional operations, particularly for critical applications, we offer a subscription. It includes:

- ✓ Ongoing development of OSISM and OpenStack
- ✓ Critical security vulnerabilities fixed within 48 hours
- ✓ Up-to-date documentation and quality assurance
- ✓ Support with updates and upgrades
- ✓ Defined response times, including round-the-clock cover via our partners

Partner network

Storage, networking, security hardware, integration – many areas of cloud infrastructure are disciplines in their own right. To support you even with specialist requirements, we work closely with specialised European companies. Several of our partners also operate their own cloud infrastructures using OSISM, which you can use directly.

Seminars

Expertise comes from understanding. That is why we teach managers and technical specialists the things that really matter. Our aim is to enable you to make well-informed decisions and operate your cloud environment independently. For us, that is the essence of digital sovereignty.

Looking to build your own cloud or run an existing one with greater sovereignty?
We're happy to talk about what's required in a no-obligation conversation.
